December 25, 2025

Dear Hiring Manager,

I am applying for a developer role where building reliable, user-centered software is the focus. I am a Computer Science graduate student at **Georgia State University** with hands-on experience designing, building, and deploying modern web applications from end to end.

I enjoy working across the stack, but I care most about outcomes: interfaces that feel intuitive, APIs that behave predictably, and systems that are easy to maintain and extend. I aim to write code that other developers can understand and users never have to think about.

One of my core projects, **Job Ledger**, is a production-ready web application designed to help users organize and analyze their job applications. I led the project from concept to deployment — designing the UI, building REST APIs, modeling relational data, and implementing secure authentication with user-scoped access control. The application supports full CRUD workflows, analytics dashboards, and external job-feed ingestion, and is deployed with environment-based configuration.

I also built **HandyHub**, a community-driven platform where users can ask questions, contribute answers, and engage through voting and rewards. The project required careful component design, client-side state management, and a clean data model to support authentication, private routes, search, filtering, and responsive layouts.

Beyond individual features, I am comfortable with the practical realities of software development: deployment, environment variables, routing issues, authentication edge cases, and performance tradeoffs. I have deployed applications using modern hosting platforms, debugged production issues, and iterated quickly based on real usage.

My background in data and analytics also shapes how I approach software design. I think carefully about data flow, schema evolution, and how early architectural decisions affect long-term flexibility. I try to build systems that are simple to reason about and resilient as requirements change.

I am looking for an opportunity where I can contribute as a developer, learn from experienced teammates, and help ship software that people rely on. If your team values thoughtful engineering, clear communication, and ownership, I would welcome the opportunity to connect.

Sincerely,

Omar Madijtov
